

RWA SHIELD

Oracle price is not cash. We price recoverable collateral.

Warsaw · 27.09.2026

Oracle price $\neq$ cash in the pool

First user: Solana lending / vault integrating xStocks — not retail.

\$200M+

Tokenized-equity trading volume on Solana in one day (12.09.2026)

\$53M

Tokenized-stock lending TVL on Solana, all-time high (late Jul 2026)

~63%

Of cumulative trading through Aug 2026, settled outside US market hours

Sources: Solana Compass 13.09.2026 (Solana Foundation newsletter); Crypto Briefing 23.07.2026 + Solana Compass 24.07.2026 · not audited

Fixed LTV treats a mark as recoverable USDC. Thin books say otherwise.

ECV — Executable Collateral Value

One job: tell the venue what is still recoverable USDC under stress.

max_borrow

collateral_cap

liquidation_route

risk_premium

borrow_disabled

Works today: ECV engine + breaker demo + ECV record published on Solana devnet (Anchor).

Five frozen outputs = the on-chain interface — published on Solana devnet (not mainnet).

Watch the breaker

01

Oracle price

02

ECV under stress

03

Breaker: WARNING

TSLAx • \$100k • stress sandbox: ECV \$84,358 • safe max borrow \$58,684 vs Kamino LTV \$55,000 • WARNING: USDC reserve utilization at the 90% rate kink

Same book. Two models. Synthetic in-sample.

~\$3.98M

Fixed 70% LTV · bad debt in synthetic tail
stress

\$0

ECV · bad debt (synthetic, in-sample) + 369
refusals

SYNTHETIC IN-SAMPLE — not historical validation · not mainnet

In the tail scenario ECV refuses all 369 new loans — that is how bad debt stays at \$0.

Trade-off: calm base $\approx$ 100% of fixed-LTV credit · all six synthetic scenarios $\approx$ 27%

ECV published on Solana devnet

Anchor program `ecv_oracle` · deployed 26.09

PUBLISHES THE FIVE ECV OUTPUTS

`max_borrow`

`collateral_cap`

`liquidation_route`

`risk_premium`

`borrow_disabled`

NEXT → verifiable inputs · multi-signer posting · vault + borrow gate

Rust poster can re-post the ECV record on a schedule (`--every-sec`) · last devnet post: 26.09.2026, 19:55 (Warsaw)

Today: single-authority signer on devnet. Publishes ECV quotes; integrators enforce. Not mainnet.

Scan → Solana Explorer (devnet)

Built where the collateral already trades

xStocks venues — where the collateral already trades

Jupiter routes = the liquidation path ECV quotes (demo: Jupiter quote ladder measured 16:17 + Kamino snapshot 13:50, stress sandbox)

Composable ECV risk quotes for those venues

Monetization — hypothesis, not ARR

Risk API / SDK

ECV quotes & breakers for lending venues

Share of risk premium

When ECV sits in the borrow path

Optional vault fees

If we operate a reference vault

Hiring: Rust/Anchor · frontend

What we want next

1 Next 14 days: fix xStocks mint mapping on-chain, then a vault + borrow gate that reads the devnet ECV record

2 From you: intros to lending venues holding xStocks collateral + Rust/Anchor and frontend hires

3 Build in public — GitHub

github.com/Dorianos85/rwa-shield/tree/main/onchain

Recoverable collateral quotes — not a price print.
